UNDERGRADUATE ACADEMIC STUDIES

Course:			
Course id: 19.0R001	Mathematical analysis 1		
Number of ECTS: 6			
Teacher:	Danijela Karaklić; Zorica Savanović		
Course status:	Mandatory		
Precondition courses: None			
Educational goal			
Getting to know and mastering the	basic concepts from t	he differential and integral calculus of functions of	
one real variable.			
Educational outcomes (acquired	knowledge):		
Upon completion of the course, the	student has a basic k	nowledge of the functions of one real variable and	
the differential and integral calcu	lus. He is able to fo	llow courses in professional fields in which the	
concepts and techniques he has ma	astered are applied ar	nd to identify problems to which he can apply the	
acquired knowledge.			
Course content/structure			
Theoretical classes: Arrays. Conv	vergence criteria. The	e notion of a real function of one variable. Limit	
value of the function. Continuity o	f function. Properties	s of functions continuous on a segment. The first	
aerivative of the function. Different	tial function and appli	Ication. Higher order differentials. Basic theorems	
the extreme	mula. The notion of e	extremum. Necessary and sufficient conditions for	
Conversity of curve and head point	Curvo acumptotos A	dofinito intogral Indofinito intogral Polationshin	
of definite and indefinite integral	Shift and partial inter	ration methods. Integration of rational and some	
classes of irrational functions. Int	ogral calculus applic	ations Uncharacteristic integrals. Numeric rows	
Degree rows	Classes of infational functions. Integral calculus applications. Oncharacteristic integrals. Numeric rows.

Educational goal			
Acquisition of general and professional know	wledge in mat	hematical logic and	algebra.
Educational outcomes (acquired knowled	dge):		
Upon completion of the course, the student	has basic kno	wledge of mathem	atical logic and algebra and is
able to attend courses in professional field	ls in which th	ose concepts and t	echniques are applied and to
identify problems to acquired knowledge ca	n be applied.		
Course content/structure			
The notion of a set and basic operations with sets. Powerset. Cartesian product. The notion of relation. Equivalence relations. Order relations. A set of natural numbers. Mathematical induction. The concept of function. Injection, sirjection and bijection. Basic set identities. Countability (countability of a set of integers, set of rational numbers) and uncountableness (uncountableness of a set of real numbers). Cantor-Bernstein theorem. The axiom of choice and its equivalents.			
Proposition calculus. The notion of sent formulas. Propositional algebra. Normal fo Proving set identities using tautologies.	Proposition calculus. The notion of sentence. Basic operations of propositional logic. Propositional formulas. Propositional algebra. Normal forms - CNF, DNF. Valuation of propositional logic. Tautology. Proving set identities using tautologies.		
First-order predicate calculus. First order language. Terms and formulas. Free and bounded variables. Value of terms and formulas. Valid formulas, examples and methods of prooving (board method, scolemization, resolution method etc.).			Free and bounded variables. of prooving (board method,
The concept of algebraic structure. Basic algebraic structures. Homomorphisms; subalgebras and generating sets; direct products. Congruences. Semigroup, group, ring, field. Degree of an element in a group, Lagrangian theorem, order of an element. Cyclic groups. Euler group and Euler theorem. Isomorphism theorem for groups and applications. Polynomials over finite and infinite fields.

Course content/structure
Theoretical classes
Introduction. Number systems. Number system conversion. Numbers with a moving decimal point. Consistent of the computer systems. Basic arithmetic operations in binary number system. Incomplete complete complete complete complete and switching algebra. De Morgan's theorem. Basic logical operation combinational logic. Minimization of switching functions. Realization of arithmetic functions. Semi-arithmetic adder. Sequential logic. Memories. Computer systems architecture. Central processing CPU. Microprocessor and microcontroller architecture. Coupling of microprocessors with comp system components.
Practical classes, Exercises
Electronics Workbeanch: a tool for realizing switching functions. Realization of DeMorgan's patterns rules. Realization of minimized logic functions by logic circuits. Realization of minimization obtained Carnoux maps: product sum or product sum. Realization of a 7-segment decoder for a decimal courses and parallel port signals.

Educational goal			
Introduction to the basic areas of business English. Systematic building of adequate vocabulary and completion of knowledge of grammar basics with even practice of basic skills (reading, writing, listening & speaking). Enabling students to use professional literature in English, for proper communication in all basic areas of English business language			
Students are able to use spoken and	written Englis	sh in simpler, everyday situ	uations.
Course content/structure		in omplet, every day site	
Theoretical classes			
<ul> <li>Course content English 1 is English for academic and professional purposes in the field of informatics. Knowledge of general English at the intermediate level is assumed and professional English is processed. The main goals of teaching are methodical processing of modern professional texts and the adoption and expansion of knowledge about IT terminology, introducing students to the specific structures of the language of science and technology, as well as the systematization of relevant grammar. The most common skills are reading, understanding original English, speaking, and translating. At the end of the course, students should be able to present / understand basic topics related to their profession.</li> <li><i>Practical classes:</i> Exercises, Other forms of teaching, Study research work</li> <li>Use of article, noun, adjectives, pronouns, auxiliary verbs (be, do, have), modal verbs. Use and construction of verb tenses (Present Simple, Present Continuous, Present Perfect, Past Simple, Future forms). Questionable and negative sentence form. Vocabulary related to everyday topics: dating, family, free time, work, food and drink, naming and description of everyday objects, description of people and places and the like.</li> <li>Literature         <ul> <li>(2004): Oxford Oxford Dictionary of Business Oxford, University Press</li> <li>Mitic, G. ## **Precondition courses:** Introduction to computer science

## Educational goal

The aim of the course is to present the computer, and especially its process unit, as a technical system, to analyse its internal structure and to present the basic concepts of computer architecture, as well as to explain the concept of a set of commands and write software for modern computer systems. In addition, the aim of the course is to present the structure of modern computer systems, to give an introduction to the hierarchical organization of memory and to explain the concepts of cache and virtual memory, to explain the interrupt mechanism, its significance, use and writing software, to present communication mechanisms. with peripheral units, to introduce the basic concepts of parallel and flow execution of instructions, multiprocessor systems and computer communications.

#### Educational outcomes (acquired knowledge):

Upon successful completion of the course, the student will be able to:

- logically designs simple digital devices, and explains their work

- analyses the constituent components of computers and computer processors, evaluates their role and significance

- analyses protocols and time diagrams in inter-component communication

- analyses a set of computer processor commands and uses it to write simple programs.
- explain the operation of cache memory and virtual memory

- uses the program interrupt mechanism, analyses the capabilities of the processor from the point of view of interrupts and to write simple programs for processing interrupts

- analyses the mechanisms of communication of the processor with peripheral units

- describes the mechanisms of parallel and flow execution of commands, and presents the basic types of multiprocessor systems

- uses synchronization mechanisms in writing programs for communication and data transmission

## **Course content/structure:**

#### Theoretical classes:

Introduction to digital systems, logic circuits, combinatorial and sequential logic. The concept of a virtual machine - levels. Computer structure. Processor architecture. A set of programmatically available registers. Instruction formats. Ways of addressing. A set of instructions. Transmission instructions. Arithmetic instructions. Logical instructions. Movement and rotation instructions. Jump instructions. Other instructions. Interruption mechanism. Sources of interruption. Interrupt processing and return from the interrupt routine. Interrupt priority and interrupt masking. Masking of all masking interruptions interruption prohibition. Interruption nesting. Processor operation organization. Instruction flow diagram. Processor operations and synchronous operation. Processor structure and microoperation. Wired realization of the control unit. Firmware implementation of the control unit. Highway organization. Arbitration methods (centralized and distributed arbitration). Bus synchronization (asynchronous and synchronous control). Hierarchical organization. High performance system buses. Organization of inputs / outputs. Basic techniques. Controllers. in / and devices. Programmed in / i with readiness bit test. Programmed in / and using the interrupt mechanism. Direct access controllers (DMA). I / 0 with a DMA controller. Memory transfer - memory. Peripheral controller with DMA access. Direct peripheral control. Output multiplexing. Control of seven-segment displays. Keyboard control. Connecting D / A and A / D controllers. Basic concepts of computer communications. Memory. Basic concepts and divisions. Overlap access to memory modules. Cache memory. Associative mapping. Direct mapping. Set of associative memory. Virtual memory.

#### Practical classes:

Computational exercises. Laboratory exercises. Demonstration exercises. Electronics, switches, simple processor model, practical experiments with standard logic circuits, simulation software. Design of individual components, work in machine language, work on assembler.

#### **Educational goal**

Acquisition of general and professional knowledge of linear algebra.

## Educational outcomes (acquired knowledge):

Upon completion of the course, the student has basic knowledge of linear algebra and is able to attend courses in professional fields in which those concepts and techniques are applied. Moreover, students are capable to identify problems that can be solved using the acquired knowledge.

## **Course content/structure**

Vectors of ordered n-tuples in real and complex space. Norm, distance and angle. Vector space. Vector subspace, intersection and sum of vector spaces. Linear independence of vectors. Linear envelope. Direct product of vector spaces. Linear mappings. Base and dimension of vector space. Coordinates.

Matrices. Matrix operations. Types of matrices. Matrices of linear mapping. Equivalent and similar matrices. Rank of a matrix. Determinant, definition and properties. Bine-Cauchy's theorem. Calculation of the determinant. Inverse matrix.

Systems of linear equations. A set of solutions and its structure. Gaussian procedure. Kronecker-Capelli theorem. Kramer's theorem.

Eigenvalues and eigenvectors. Polynomials of matrices and linear operators, minimal and characteristic polynomials. Cayley-Hamilton theorem. Bilinear and square forms. Matrices of triangular and diagonal type. Diagonalization. Classification of real symmetric forms. Jordan matrix.

Euclidean vector spaces. Scalar product, norm, distance, angle. Cauchy-Schwartz inequality. Orthogonality, orthonormal base. Gram-Schmidt procedure of orthogonalization, orthogonal projection, distance between vector subspaces. Orthogonal matrices. Mixed and vector product in Euclidean vector space. Orthogonal operators, canonical bases and matrices.

## Precondition courses: None

#### Educational goal

The course aims are to give a broad insight into the field of programming languages and learning about the process of software development with special emphasis on procedural programming languages, with the use of basic data structures and algorithms, basic search and sorting.

## Educational outcomes (acquired knowledge)

The student is trained to apply top-down methods for designing algorithms. Also, the student is trained to create algorithmic solutions in the form of computer programs as well as to design, encode and test software solutions, including knowledge of techniques and methods for finding and correcting errors.

## **Course content/structure**

Lectures

Introduction to the field of programming languages. Brief overview and comparison of basic program paradigms. Activities in the process of software development and maintenance. The concept of algorithm and its role in the problem-solving process. Basic concepts from low-level programming, machine-oriented languages. High-level procedural programming languages. Fundamentals of syntax and semantics of high-level programming languages. The concept of variable, data type, operator and expression. Basic primitive and structured types. Commands. Basic control structures. Pointing mechanism and dynamic memory allocation. Structural decomposition and modularization. Subroutines. Recursion. File concept. Input / output operations. Illustration of procedural programming concepts in a specific procedural language with parallel and comparative elaboration of alternative implementation of basic concepts in other procedural languages *Exercises* 

Students independently solve tasks on the computer, going step by step through all phases of program development, from the phase of analysis of the obtained task, selection of the appropriate algorithm, implementation of the selected algorithm, to program entry in the selected environment and appropriate program testing. The topics of the tasks are harmonized with the lectures and exercises from the subject.

Seminar paper: 15						
Practical work:: 20						

Course:					
Course id.		Pedagogy			
Number of ECTS: 8					
Teacher:	Gordana P. I	Budimir-Ninković			
Course status:	Mandatory				
Precondition courses: None	<u> </u>				
<b>Educational goal:</b> The aim of the course is that students master the basics of pedagogical science, pedagogical concepts and laws and to enable them to use pedagogical sources independently and critically and understand the phenomenon of upbringing and education. Enabling students to learn independently, infer and think critically, as well as to correctly observe and explain the pedagogical phenomena. Developing interest in the study of pedagogical content and research on pedagogical phenomena. Developing love for the vocation of the educator. Gaining a positive professional attitude towards pupils in the process of educational work in primary and secondary schools. <b>Educational outcomes (acquired knowledge):</b> General pedagogical culture of a teacher; the ability to achieve the best and the most successful educational work with primary and secondary school pupils by applying the acquired practical knowledge, skills and abilities. Students are able to analyse and improve their own pedagogical competence in working with students and parents. They are able to design, implement and evaluate the cooperation of the school with the environment and the cooperation of teachers with parents. <b>Course content/structure</b> The concept and subject of pedagogy. Education as the broadest pedagogical concept and process. The importance of education and upbringing. Education and society: moral crisis, education and culture, education for tolerance and multiculturalism, education and work, education and socio-emotional development, education and individual development, education and civilisational heritage, education and ecology. The relation between upbringing and education and ecology. The relation between upbringing and education and ecology.					
pedagogy. The most famous pedagogues and their works. System of pedagogical disciplines. The relation between pedagogy and other sciences. The aim and tasks of education. Versatile personality development. Intellectual education. Aesthetic education. Psychical education. Work education. Moral education. Principles of education and upbringing. General methods and means of upbringing and education. Upbringing system. Basic factors of the education and upbringing system. Education system. Personality

Course id.	Combinatorics and graph theory		
Number of ECTS: 6			
Teacher:	Ivan D. Pavk	ov	
Course status:	Mandatory, t	hird year, fifth sem	lester
Precondition courses: Mathematical logic and algebra			
Educational goal			
Acquiring basic knowledge of combinatorics	and graph th	eory.	
Upon completion of the course, the student and be able to apply them in problems in which the concepts and techniques he has r apply the acquired knowledge.	should have practice. He is nastered are a	basic knowledge of s able to follow com applied and to iden	f graph theory and algorithms urses in professional fields in tify problems to which he can
Course content/structure:			
Theoretical classes:			
Counting. Permutations of sets. Combinations of sets. Binomial formula. Permutations and combinations of multisets. Polynomial formula. On and off formula. Dirichlet principle. Breaking numbers into additions. Number of circulations. Stirling numbers of the second and first kind. White numbers. Generator functions. Differential equations. Fibonacci numbers. Concept, parts and types of graphs. Isomorphism of graphs. Walks, chains, roads, cycles. Connectivity. Planar graphs. Euler's and Hamilton's graphs. The commercial traveller problem. The shortest path problem. Dijkstra and the Floyd-Worschel algorithm. Trees. Kruskalov and Primov algorithm. Representation of graphs by matrices. Colouring graphs. Chromatic number. Applications of graph theory in computing.			
Practical classes:			
Tasks from the stated theoretical areas.

Course:				
Course id:	Databases 1			
Number of ECTS: 6				
Teacher:	Vesin D. Boban			
Course Status:	Mandatory, the third	year, the fifth semester		
Precondition courses: None				
Educational goal				
The aim of the course is understa	nding and adopting th	e basic concepts and techniq	ues of relational	
databases.				
Educational outcome (acquired ki	nowledge)			
Upon completion of the course, st	tudents acquired the b	asic concepts and techniques	s of data	
modelling. They are able to:				
- represent simpler databases by	creating relational cor	nections between entities		
- convert entity relationship diag	rams (ER diagrams) in	to the relational schema mod	del in standard	
normal form				
- interactively use the SQL langua	ige			
Course content/structure	0			
Theory classes				
Database systems: history and motiv	ation; components. Data	base management systems; fun	ctions; database	
architecture and data organization; o	data independence. Data	modelling: conceptual models;	entity-relationship	
data model. Relational data model; relational algebra and relational calculus. Database query languages;				
review; SQL. Designing relational databases; functional and ambiguous dependency; normal forms.				
Practical classes: Practicing the basic principles of relational algebra and relational calculus. Practicing				
database representation by creating relationships between entities. Mastering basic SQL techniques by writing				
and performing queries on a given d	atabase.

Course:				
Course id.		English laı	nguage 3	
Number of ECTS: 5				
Teacher:	Afer	dita Crnisanin		
Course status:	Com	pulsory, fourth year, fifth	semester	
Precondition courses: English lang	guage 2			
Educational goal	5 0			
Students are introduced to the basi main goal is to provide students w information literature in English. S vocabulary, i.e. the contents of the significant place in grammar.	Students are introduced to the basic concepts from the narrower field of profession in English, where the main goal is to provide students with knowledge of the professional language for quality monitoring of information literature in English. Since, in order to achieve that goal, it is equally necessary to know the vocabulary, i.e. the contents of the English language itself, as well as the language structures, have a similicant place in grammar.			
Educational outcomes (acquired	knowledge):			
The student understands texts and l communication skills. The student knowledge in English in written and	has the ability can use profe l oral commun	to present professional con essional literature and exp ication	tent with special empha ress his ideas as well a	asis on as new

Course:			
Course id: 19.010037	Fundamentals of geometry		
Number of ECTS: 7			
Teacher:	Miroslava Mih	najlov Carević	
Course status:	Elective		
Precondition courses: None			
Educational goal: Introduction	to basic concep	ts from the basic	s of geometry and analytical geometry, as
well as training students for abs	tract thinking.		
Educational outcomes (acqui	red knowledge	e): Upon comple	tion of the course, the student has basic
knowledge of the basics of geor	netry and analyt	tical geometry an	d is able to follow courses in professional
fields in which mathematical n	nodels are creat	ted and solved.	The student is able to perform analytical
formulas of geometric objects	and examine	their mutual po	osition and to apply this knowledge to
mathematical modelling of spec	ific problems, as	well as to geome	etrically interpret the obtained results.
Course content/structure			
<b>Theoretical classes:</b> A brief ov	erview of the his	story of geometry	r, the development of the idea of axiomatic
grounding. Axiomatic introduct	ion of geometry	y. Absolute geom	netry - axioms of incidence, arrangement,
congruence and continuity (De	dekind's axiom)	). Axiom of paral	llelism (Euclid's fifth postulate). Hilbert's
axiom system. Transformations	of coincidence a	and similarity. Re	elation of congruence of geometric figures,
congruence of lengths, congrue	ence of angles, o	congruence of tr	iangles. Isometric transformations in the
plane, axial and central symm	ietry, translatio	n. Classification	of isometric transformations. Historical
development of the idea of hyperbolic geometry. Lobachevsky's axiom, non-Euclidean (hyperbolic)			
geometry. Parallelism and hyperparallelism.			
Foundation forms equal. The distance of a point from a plane. The mutual position of the two planes and the			
Equation forms equal. The distance of a point from a plane. The mutual position of the two planes and the			
angle between them. The equation of the line in space, the vector, parametric and canonical form of the			
The distance of true line of the	uation that pass	es through two p	ooints. The distance of a point from a line.
The distance of two lines in spa	ace. The angle b	etween two line	s. The mutual relationship is straight and
equal.

<ul> <li>Educational goal is to provide skills and knowledge in project management in scope of software development of information systems. Student will be introduced with basic principles in scope of project management. Project approach and application in the business processes. Basic conditions of successful management of project with special focus on importance of the project domain definition, planning, project management, and resources.</li> <li>Educational outcomes (acquired knowledge):         The students will be capable to work on the projects, and they will be introduced with most common problems and existing solutions for management of different types of the projects. The focus is on the teamwork and execution of processes using empirical methods.     </li> <li>Course content/structure         Theoretical leatures     </li> </ul>			
Introduction to projects. Meaning and importance of project management. Historical approach to development of the project management topic. Important factor of successful and unsuccessful project execution. Project lifecycle. Project organisation. Project manager. Decision support software for project management. Project documentation. Project evaluation. MS Project 2010.  Practical course: Laboratory practice includes definition of the scope of the problems that will be analysed, facts and theoretical approach to be identified, using interactive approach. Students will be familiarized with standard information solutions for project management. Sections given during the lectures will be			
the topic and develop the project in a team. The final outcome is submission of the project proposal to active tenders and call for funding.

## **Educational goal**

The primary goal of this course is to introduce students to the basic principles of mobile application development, with a focus on the Android platform. The secondary goal of this course is to gain experience and practical skills in the development and implementation of applications for Android mobile phones through work on practical projects. Among other things, another goal of the course is for students to acquire the necessary skills to conduct research activities in this dynamic area by exploiting existing environments and simulators, such as the Android Studio software package.

#### Educational outcomes (acquired knowledge):

The general competencies that students will acquire are analysis, synthesis and prediction of solutions and consequences, mastering research methods, procedures and processes, as well as applying knowledge in practice. The professional outcome of this course includes the following components: understanding the hardware and software platform of mobile devices; understanding the basic concepts of mobile application development - what are the basic characteristics, benefits and challenges, as well as understanding limitations such as limited battery life and the need to save energy; training for independent application of basic concepts of mobile applications and understanding of trade-offs in energy use and execution efficiency, in order to implement mobile applications that are robust, usable and efficient; training for independent application development for Android phones.

#### **Course content/structure:**

## Theoretical classes:

The role of mobile application development in the software industry. Features of mobile devices. An overview of hardware platforms and operating systems. Development environments and programming languages for mobile devices. Mobile application architecture. User interface development. Activity as a basic component of the Android application. Explicit and implicit intentions, fragments, application data storage (SQLite database, Shared Preferences). AsyncTask and Internet connection. Use an external API to retrieve data. Applications based on Content Provider and Broadcast Receiver components. Services for background work, work with sensors and application localization.

## Practical classes:

Practical classes follow theoretical classes and are realized in computer classrooms. During the practical classes, students will gain insight into setting up the development environment, setting up emulators, as well as developing mobile applications for Android phones and the practical application of the principles adopted during the theoretical classes.

Number of active teaching classes	Lectures: 3	Practical classes: 3
Teaching methods		

Teaching is performed using ICT, where in addition to classical teaching methods, modern presentation and demonstration tools and techniques are used, using an interactive method of working with students. Lectures and exercises are performed using didactic and educational content in electronic and digital form (which includes recorded lectures and mentoring exercises) on various video presentation media.

Knowledge evaluation (maximum 100 points)

Course: Course id.	Informatics teaching methodology
Number of ECTS: 8	
Teacher:	Lazar Kopanja
Course status:	Elective, third year, sixth semester
Precondition courses: None	

## Educational goal

Training for pedagogical work in the field of informatics and introduction to software packages that are processed and used in school.

## Educational outcomes (acquired knowledge):

Students will be able to independently teach computer science in primary and secondary schools.

## **Course content/structure:**

#### Theoretical classes:

Preparation of classes. The structure of time. Time planning. Board planning. Teaching aids planning. Planning the required software. Planning the necessary data. Sequence of actions. Exposure speed. Tests and evaluation. Work with different ages. Didactics of IT contents. Operating system. Internet. Standard software packages: Word processing. Worksheets. Presentations. Database. Drawing. Computer center maintenance. Procurement of equipment. Equipment maintenance. Local area network. Software maintenance. Selected topics. Manual skills required. Independent student projects. Computer-assisted education in various fields. Educational software. Distance learning.

## Practical classes:

Exercises, Other forms of teaching, Study research work, Preparation of necessary resources. Presentation of materials. Tests and evaluation. Discussions. Student work control. Practical practice of classes in school according to the contents of theoretical classes.

Course:		
Course id.	Probability and statistics	
Number of ECTS: 6		
Teacher:	Dragiša Žunić	
Course status:	Mandatory, third year, sixth semester	
Precondition courses: Mathematical Analysis 1, Combinatorics and Graph Theory		

#### **Educational goal**

Acquiring basic knowledge of probability theory and training for the application of that knowledge in solving problems from practice. Introduction to the basic methods of descriptive and analytical statistics and training for the application of these methods in solving problems in practice. Knowledge of probability theory is the basis for understanding the methods and models of statistical analysis

#### Educational outcomes (acquired knowledge):

At the end of the course, the successful student is expected to fully master the basic concepts and applications of probability and statistics. He is able to apply statistical tests and simulation methods to study real phenomena. Special emphasis is placed on understanding descriptive statistics and statistical inference.

## **Course content/structure:**

## Theoretical classes:

Probability theory-space of elementary events. Definition of probability and basic properties. Conditional probability and independence of events. The formula of total probability. Bayesian formula. Random events, traits. Operations and relations with random events. One-dimensional random variables of discrete type. One-dimensional random variables of continuous type, parameters of a random variable. Discrete distribution models. Continuous distribution models. Boundary value theorems in probability. Twodimensional random variables of discrete type. Two-dimensional random variables of continuous type. Marginal distributions. Conditional distributions. Regression analysis. Statistical inference, population, sample. Descriptive statistics, statistical features. Frequency distribution, graphical display of frequency distribution. Landmark parameters, indices. Statistics and their distributions. Evaluation theory, evaluation selection criteria. Confidence intervals. Hypothesis testing. Parametric tests. Nonparametric tests. Regression models. Methods of analysis of variance. Statistical packages (SPSS). Individual indices. Weighted and unweighted group indices. Time series analysis - moving average method. Autoregressive models.

Practical classes:

Tasks in the above areas.

Course id:	Artificial intelligence 2		
Number of ECTS: 7	<u> </u>		
Teacher:			
Course status:	Elective, fo	ourth year, eighth semester	
Precondition courses: Probability and	Statistics, A	Artificial Intelligence 1	
Educational goal			
The course introduces students to ac	lvanced top	pics in the field of artificial intelligence, with special	
emphasis on the theoretical foundatio	ns of advar	nced techniques and tools for implementation. Topics	
related to specific modern techniques	s of superv	vised, unsupervised and semi-supervised learning are	
covered.			
Educational outcomes (acquired kno	wledge):		
Students will learn to interpret and c	onnect vari	ious advanced algorithms and approaches to artificial	
intelligence. Scientists provide data, id	entify and s	select the most appropriate approaches, regularization	
techniques, as well as monitor the tra	ining proces	ess and adjust regularization parameters. Students will	
master the use of a number of software	tools and m	nachine learning algorithms.	
Course content/structure			
Neural networks: introduction, archite	ctures and t	training procedures, evaluation and application. Group	
learning: bagging and boosting. Clu	ustering-adv	vanced algorithms, mixture-based models and the	
expectation maximization algorithm	(EM). Gene	etic algorithms. Semi-supervised algorithms. Hidden	
Markov models. Probabilistic graphic m	odels (infer	rence, belief propagation, practical application).

Teacher:	Milena V. Radenković
Course status:	Mandatory, fourth year, eighth semester

#### Precondition courses: None

## **Educational goal**

The aim of the course is to master the theoretical and mathematical foundations of computer graphics, as well as the use of certain software applications in computer graphics.

## Educational outcomes (acquired knowledge):

Students will be trained to use software tools in computer graphics as well as to work in graphic and design studies. They will also be able to follow technological advances in the field of computer graphics.

## **Course content/structure:**

#### Theoretical classes:

Introduction to computer graphics. Basic concepts. Vector and raster graphics. Colour models. Hardware components for graphic input and output. Graphical user interfaces (GUI). The place and role of models in computer graphics. Light sources. Camera model. Working with cameras. Coordinate systems in computer graphics. Geometric interpretation of two-dimensional graphic transformations (translation, rotation, scaling, reflection, distortion). Transformations from the global coordinate system to the coordinate system of the plane of observation. Two-dimensional truncation (point truncation, line truncation, polygon truncation). Three-dimensional truncation. 2D and 3D graphics. 2D to 3D image conversion and vice versa. Work with different graphic formats and software applications.

## Practical classes:

Follows theoretical classes (work with vector and bitmap graphics, making flyers, posters, business cards, stickers, cover pages, prepress, work with software for 2D to 3D image conversion).

Number of ECTS: 6				
Teacher:	Kopanja S. Lazar			
Course Status:	mandatory, fuorth y	ear, eighth semester		
Precondition courses: Mathematical a	nalysis 2, Probability	and statistics		
Educational goal				
The aim of the course is to provide a b	proad foundation in th	e field of computer image pro-	cessing and	
analysis; to present technical solutions	s for obtaining digital	images, to expose mathematic	al	
transformations and filtering of two-d	imensional signals, al	gebraic, statistical methods, lo	gical and	
morphological methods and methods	of image analysis; to	present some solutions in the d	omains of coding	
and summarizing visual information,	modelling objects and	I the environment, object recog	nizing and	
drawing conclusions from static and d	lynamic images.			
Educational outcome (acquired know	vledge)			
Upon successful completion of the cour	se, students will be ab	le to:		
- make a decision on the conditions for	recording digital imag	es of the required quality		
- apply mathematical transformations t	o two-dimensional fur	nctions		
- apply algebraic, statistical and morphe	ological methods to im	ages to extract important comp	onents or details	
- design and program algorithms for au	tomatic drawing of co	nclusions from particular classe	s of static and	
dynamic images				
Course content/structure				
Theory classes				
Introduction to optics and optical	sensors for digital im	age acquisition, discretization	and quantization;	
application of Fourier transform	to two-dimensional f	unctions; a review of some i	mportant integral	
transformations applied to image	processing; applicati	on of algebraic transformation	ns; application of	
statistical methods for the purpose	of analysis and imag	e processing; morphological a	nalysis of images;	
separation of components from im	ages, image segment	ation; image compression; dra	wing conclusions	
from static and dynamic images.

Course content/structure The Supervisor of the Final thesis assigns a topic from the area covered by the curriculum, which the candidate can successfully process within three months, based on the acquired knowledge, study of the relevant literature, practical or experimental work.  Literature Relevant literature in the field of research, which is directly related to the topic of the Final thesis.  Number of active teaching classes (weekly) Lectures: Practical classes: Methods of execution: The student can write the Final thesis from all professional subjects passed with the lowest grade 8. The Rulebook on writing the Final thesis at undergraduate or master academic (master) studies at Alfa BK University in Belgrade stipulates the procedure for applying for, writing and defending the Final thesis and its defence.	write professional or scientific papers,	present	professional problems an	nd represent certain professional	
Educational outcomes (acquired knowledge):         By preparing and defending the Final thesis, students are able to solve real applicable problems, as well as to consider and analyse theoretical solutions. This includes developed critical thinking, the ability to analyse problems, synthesize solutions, and predict the consequences of the selected solution, using scientific methods and procedures. Especially important is the ability to adopt relevant innovations in the professional and general public.
